US-09-270-767-44579

Sequence 44579, Application US/09270767

Patent No. 6703491

GENERAL INFORMATION:

TITLE OF INVENTION: Nucleic acids and proteins of Drosophila melanogaster

TITLE OF INVENTION: Nucleic acids and proteins of Drosophila melanogaster

CURRENT APPLICATION NUMBER: US/09/270,767

CURRENT FILING DATE: 1999-03-17

NUMBER OF SEQ ID NOS: 62517

SOFTWARE: PATENTING DATE: 2.0

SEQ ID NO 44579

LENGTH: 307
                                                                                                                                                                              Gaps

Novel antigenic P5-like fimbrin subunit peptides used in vaccines against Haemophilus influenza.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae, Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAY79955 to AAY79953, and AAZ91201 to AAZ31252, represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Vaccine, non-typeable Haemophilus influenzae; ntHi; infection; chimeric protein; Haemophilus influenzae; P5-like fimbrin protein; llipoprotein D; LB1(f); immunogenic; antigenic; otitis media; sinusitis; onjunctivitis; lower respiratory tract infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Non-typeable H. influenzae 1715MEE Group 2a type peptide.

Novel antigenic P5-like fimbrin subunit peptides used in vaccines against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P9-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. ANY19955 to ANY1993, and AAX91201 to AAX91252, represent sequences used in the exemplification of
                                                                                                                                                          Vaccine; non-typeable Haemophilus influenzae; ntHi; infection; chimeric protein; Haemophilus influenzae; P5-like fimbrin protein; lipoprotein D; LBI(f); immunogenic; antigenic; otitis media; sinusitis; conjunctivitis; lower respiratory tract infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         LB1(f) containing peptide from strain ntHi-1715MEE (Group 2a type).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  surface exposed loop; major outer membrane protein P5; MOMP P5; non-typeable H. influenzae; ntHi; LB1(f) peptide; B cell epitope; ottiis media; sinustiis; conjunctivitis; lower respiratory tract infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel antigenic P5-like fimbrin subunit peptides used in vaccines against
Haemophilus influenza.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAV79955 to AAV79993, and AAZ31201 to AAZ91202, represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Vaccine; non-typeable Haemophilus influenzae; ntHi; infection; chimeric protein; Hemophilus influenzae; PS-like fimbrin protein; lipoprotein D; LB1(f); immunogenic; antigenic; otitis media; sinusitis; conjunctivitis; lower respiratory tract infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

Novel antigenic P5-like fimbrin subunit peptides used in vaccines against
Haemophilus influenza.
                                                                                                                                                                                                            The sequences given in AAB47439-46 represent peptides which may be used to replace one or more surface exposed loops of major outer membrane protein PS; (MOMP PS) of non-typeable H. influenzae (ntHi). Each of these peptides contain an LBI(f) peptide which is a 19 amino acid peptide derived from the sequence of MOMP PS from strain ntHill28, representing amino acids Argl17 to Glyl35. This peptide represents the third exposed loop of PS and is a potential B cell epitope. The loops of the invention are modified in terms of being in a non-native environment in the recombinant outer membrane protein. The modified MOMP PS may be used to induce an immune response in a mammal to prevent or treat Heemophilus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Vaccine; non-typeable Haemophilus influenzae; ntHi; infection; chimeric protein; Haemophilus influenzae; PS-like fimbrin protein; lipoprotein D; LB1(f); immunogenic; antigenic; otitis media; sinusitis; conjunctivitis; lower respiratory tract infection.
                                                             Recombinant bacterial outer membrane protein where one or more surface exposed loops are modified is useful as a vaccine to prevent or treat Haemophilus influenzae infection or associated disease, e.g., otitis
                                                                                                                                                                                                                                                                                                                                                                                                                                      influenzae infection or associated disease, e.g., otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Length 31;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Indele

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequences given in AAB47439-46 represent peptides which may be used to replace one or more surface exposed loops of major outer membrane protein PS; (MOMP PS) of non-typeable H. influenzae (ntHi). Each of these peptides contain an LB1(f) peptide which is a 19 amino acid peptide derived from the sequence of MOMP PS from strain ntHill28, representing amino acids Argl17 to Gly135. This peptide represents the third exposed loop of PS and is a potential B cell epitope. The loops of the invention are modified in terms of being in a non-native environment in the recombinant outer membrane protein. The modified MOMP PS may be used to induce an immune response in a mammal to prevent or treat Heemophilus
                                                                                                                                                                                                                                                                                                     Recombinant bacterial outer membrane protein where one or more surface-
exposed loops are modified is useful as a vaccine to prevent or treat
Haemophilus influenzae infection or associated disease, e.g., otitis

The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otilis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. Affluenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAY79955 to AAY79993, and AAZ91201 to AAZ91202, represent sequences used in the exemplification of the present invention

Novel antigenic P5-like fimbrin subunit peptides used in vaccines against Haemophilus influenza.
                                                                                                                                                                                                                                   Novel antigenic P5-like fimbrin subunit peptides used in vaccines against
                                                                                                                                                                                                                                                                                                                   The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAX719955 to AAX79993, and AAS91201 to AAX91252, represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Vaccine, non-typeable Haemophilus influenzae, ntHi, infection, chimeric protein, Haemophilus influenzae, P5-like fimbrin protein, lipoprotein D; LB1(f), immunogenic, antigenic, otitis media, sinusitis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel antigenic P5-like fimbrin subunit peptides used in vaccines against
Haemophilus influenza.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract influenzae. Antibodies may also be used in vaccines against H. Influenzae and probes from the present invention can be used for diagnosis of H. influenzae infection. AAY79955 to AAY7993, and AAZ91201 to AAZ91252, represent sequences used in the exemplification of the present invention

The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract influenzae. Antibodies may also be used in vaccines against H. influenzae and probes from the present invention can be used for diagnosis of H. influenzae infection. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAY79955 to AAX79993, and AAX91201 to AAZ91252, represent sequences used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Vaccine; non-typeable Haemophilus influenzae; ntHi; infection; chimeric protein; Haemophilus influenzae; P5-like fimbrin protein; lipoprotein D; LB1(f); immunogenic; antigenic; otitis media; sinusitis; conjunctivitis; lower respiratory tract infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ä
                                                                                                                                                                                                                                                                                                                                                                                                  The sequences given in AAB47439-46 represent peptides which may be used to replace one or more surface exposed loops of major outer membrane protein PS (MOMP PS) of non-typeable H. influenzae (ntHi). Each of these peptides contain an LBI(f) peptide which is a 19 amino acid peptide derived from the sequence of MOMP PS from strain ntHill28, representing amino acids Argl17 to G1y13. This peptide represents the third exposed loop of PS and is a potential B cell epitope. The loops of the invention are modified in terms of being in a non-native environment in the recombinant outer membrane protein. The modified MOMP PS may be used to induce an immune response in a mammal to prevent or treat Haemophilus sinfluenzae infection or associated disease, e.g., otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection
                                                                                                                                                                                                                                                                                                                      Recombinant bacterial outer membrane protein where one or more surface-exposed loops are modified is useful as a vaccine to prevent or treat Haemophilus influenzae infection or associated disease, e.g., otitis

The sequences given in AAB47439-46 represent peptides which may be used to replace one or more surface exposed loops of major outer membrane protein Ps (MOMP Ps) of non-typeable H. influenzae (ntill). Each of these peptides contain an LB1(f) peptide which is a 19 amino acid peptide derived from the sequence of MOMP Ps from strain ntHill28, representing amino acids Argl17 to Gly135. This peptide represents the third exposed loop of Ps and is a potential B cell epitope. The loops of the invention are modified in terms of being in a non-native environment in the recombinant outer membrane protein. The modified MOMP Ps may be used to induce an immune response in a mammal to prevent or treat Haemophilus influenzae infection or associated disease, e.g., ottis media, sinusitis, conjunctivitis, or lower respiratory tract infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Hyperblebbing; Gram-negative bacterium; genetically modified; Tol gene; peptidoglycan-binding; peptidoglycan-associated slte; outer-membrane; bacterial infection; vesicle-shedding; Bleb; filter sterilised; detergent; deoxycholate; homogeneity; antibacterial; vaccine; HiRD; PS; P6; PCP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Recombinant bacterial outer membrane protein where one or more surface-exposed loops are modified is useful as a vaccine to prevent or treat Haemophilus influenzae infection or associated disease, e.g., otitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gape

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ð
                                                                                                                                                                The present invention relates to a new hyperblebbing Gram-negative bacterium genetically modified by one or more processes selected from down-regulating expression of one or more Tol genes and attenuating the peptidoglycan-binding activity by mutation of one or more gene(s) encoding a protein comprising a peptidoglycan-associated site. The invention is useful in a method of treatment of the human or animal body. The invention is also useful for protecting an individual against a bacterial infection. The invention has improved outer-membrane vesicles shedding properties. Blebs are more easily made in higher yield from the invention, and are more hongeneous in nature and can be more readily filter sterilised. The blebs can be made and harvested without the use of detergents such as deoxycholate, thus obviating chromatography filter sterilised. The blebs to be made and harvested from the invention have reduced particle size (allowing sterile filtration through 0.22 mum pores), increased batch honogeneity, and a superior yield. The present amino acid sequence represents a Haemophilus influenzae protein,
                                                                                                                                                                                                                                                                                                                                                                                                                                      1;
                                                                                            Novel hyperblebbing Gram-negative bacterium that has been genetically modified by down-regulating expression of Tol genes, and/or attenuating peptidoglycan-binding activity useful for treating bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

One or more surface exposed loops of this protein may be replaced with a modified peptide of the invention. Each of these peptides contain an LB1(f) peptide which is a 19 amino acid peptide derived from the sequence of MOMP P5 from strain ntHill28, representing amino acids Argll7 to Glyl35. This peptide represents the third exposed loop of P5 and is a potential B call epitope. The loops of the invention are modified in terms of being in a non-native environment in the recombinant outer membrane protein. The modified MOMP P5 may be used to induce an immune response in a mammal to prevent or treat Haemophilus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Vaccine; non-typeable Haemophilus influenzae; ntHi; infection; chimeric protein; Haemophilus influenzae; P5-like fimbrin protein; lipoprotein D; LB1(f); immunogenic; antigenic; otitis media; sinusitis; conjunctivitis; lower respiratory tract infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Recombinant bacterial outer membrane protein where one or more surface-exposed loops are modified is useful as a vaccine to prevent or treat Haemophilus influenzae infection or associated disease, e.g., otitis

the 6213 antiense sequences given in the specification where expression of the mucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the mucleic acid encoding a promoter operably linked to the mucleic acid comprising a promoter operably linked to the mucleic acid containing the vector; (3) an isolated or polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular containing the polypeptide; (7) identifying a gene in an operon required for proliferation, or that has an activity against a biological pathway contained for proliferation, or that inhibits cellular proliferation or the activity of compound that influences the activity of identifying a gene required for cellular proliferation of the pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound; a activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the tearget of a compound that inhibits the proliferation of an organism. The antisense nucleic acids required for proliferation of sereening for homologous nucleic acids required for proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation to isolate candidate molecules for rational confident did not form pate of the present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this paternal of the prince of specification, of the present sequence is encoded by one of the present of the present sequence agains of the present of th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          gene disruption; gene targeting; marker gene; transformation; homologous recombination; hyperthermostable archaebacterium; KOD1; gene structure; gene function; enzyme activity; medicine; forensic science; food; drug inspection; molecular biology; immunology

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                              Novel antigenic P5-like fimbrin subunit peptides used in vaccines against
Haemophilus influenza.
                                                                                                                                                                                                   The present invention describes antigenic PS-like fimbrin subunit peptides (LB1(f) peptides) of PS-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. Influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAY79955 to AAY79993, and AAZ91201 to AAZ91252, represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated nucleic acid comprising any one of

This invention relates to a novel method for targeting disruption of an arbitrary gene in a genome of an organism which comprises providing the whole sequential date of the genome of such organism, selecting at least a rebitrary region in the sequence, providing a vector that contains a sequence homologous with the selected region and a marker gene, contains a sequence homologous with the selected region and amaker gene, contains a contains a sequence homologous recombination. The genome is preferably the genome of a hyperthermostable archabacterium, particularly the genome of a paper in the genome of an organism, which is applicable in studying gene structure and functions as well as enzyme activities of concoded proteins and useful in medicine, forensic science, food or drug inspection, molecular biology and immunology. With this method, the concoded by the genome of Thermococcus kodakaraensis which was derived efficiently and reliably. The present sequence is that of a protein encoded by the genome of Thermococcus kodakaraensis which was derived efficiently and reliably. The present sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the present sequences.

It is electronic format directly from WIPO at the print was obtained the without and part of the printed specification, but was obtained the was obtained the print was obtained the pr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1;
  Method for disrupting targeted gene in genome of organism particularly thermostable bacterium and with genome chips for analysis, applicable in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The invention relates to a novel urinary specific nucleic acid molecule (USNA). A protein encoded by a USNA of the invention has cytostatic activity. The USNA may have a use in gene therapy, and as a vaccine.

These nucleic acids and polypeptides are also useful for diagnosing and monitoring the presence and metastases of urinary cancer in a patient. The artibody that specifically binds to the lung specific polypeptide is useful for determining the presence of a urinary specific protein in a sample, as well as for treating a patient with cancer, particularly by inducing an immune response against the urinary cancer cell expressing the urinary specific genes and proteins are useful for identifying, these urinary specific genes and proteins are useful for identifying, diagnosing, monitoring, teaging, imaging and treating urinary cancer (e.g. squamous cell carcinoma) and non-cancerous disease states in the urinary. The sequences shown in ADD71534-ADD71716 represent urinary
                                                                                                                                                                                                                                                                                                                                     ö
           The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA sequence (ABL16176-ABL30511), between the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New urinary specific genes and proteins, useful in gene therapy or as vaccines for treating urinary cancer or non-cancerous urinary diseases, as well as for diagnosing, monitoring or staging such diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            human; urinary specific nucleic acid; USNA; cytostatic; gene therapy; vaccine; urinary cancer; urinary specific protein; USP; cancer; squamous cell carcinoma.
                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence represents a cytochrome P450 protein, CYP94A6, of tobacco that is expected to have fatty acid hydroxylase activity since is displays the characteristic signature motif for this class of enzymes.

The invention provides isolated mucleic acids (see AAX58400-06) encoding plant fatty acid hydroxylases (see AAY05896-902). Also claimed are host cells, transpenic plants and compositions consisting of the plant fatty acid hydroxylase genes from a plant, and a process of altering fatty acid hydroxylase genes from a plant, and a process of altering fatty acid hydroxylase genes from a plant by expressing the plant fatty acid dydroxylase in a plant by expressing the plant fatty acid dydroxylase in a plant by expressing the plant fatty acid content composition in a plant by expressing the hydroxylated fatty acid content of plants will modify resistence to drought and attack by insects and content peats. The transgenic plants may also be used as sources of hydroxylated and epoxidized fatty acids useful in the manufacture of e.g. lubricants, anti-slip agents, plasticisers, coating agents, detergents

The present invention describes proteins and their fragments (I) encoded by chromosome 2 of the human malarial parasite, Plasmodium falciparum. Also described are: (I) nuclectide sequences (II) encoding (I); and (2) vaccines against P. falciparum infection comprising (I) or (II). (I) and (II) are useful for the development of vaccines against P. falciparum infection. (I) and polyclonal antisera or a monoclonal antibody raised to infection. (I) and polyclonal antisera or a monoclonal antibody raised to comparising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, (I) (especially when they are rifins or secreted or membrane proteins) can aid the identification of infection with P. falciparum infection, or they can be used to identify drug resistance in P. falciparum. Sequencing of the coded by it will help to expand our understanding of proteins encoded by it will help to expand our understanding of parasite biology, comparing the vaccine and drug development. Parasite resistance to drugs and mosquito resistance to insecticides have led to a resurgence of malaria in many parts of the world, and there is a pressing need for vaccines and new drugs. AAA70038 to AAA70287 and AAB18144 to AAB18352 represent nucleotide and protein sequences given in the present invention, but which are not specifically mentioned within the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antisense; prokaryotic essential gene; cell proliferation; drug design.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SXXXXXXXXXXXXXX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel isolated polynucleic acid segment modulated within a cell by posttranscriptional gene silencing (PTGS). The invention specifically relates to a method to identify an expression product that is modulated by PTGS. The polynucleotide is useful for modulating the gene expression within a cell by PTGS, by introducing the polynucleic acid into a cell and expressing the nucleic acid segment in the cell to form a product. The polynucleic acid segment is also useful for augmenting a cell and expressing the nucleic acid segment in the call contacting a plant cell with the segment to produce a transformed plant cell, and growing the transformed plant cell to produce a differentiated transformed plant. The sequences shown in ABP81173 - ABP81298 represent the product of a segment of A. thaliana cDNA modulated by PTGS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel polynucleic acid segment useful for modulating gene expression within a cell by posttranscriptional gene silencing, and for augmenting a plant cell genome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Plasmodium falciparum; chromosome 2; human malaria parasite; vaccine;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The invention relates to new Proteus mirabilis polypeptides and polymucleotides. The invention also relates to antibodies against the polypeptides, methods for producing the polypeptides, method of generating vaccines for immunishing an individual against P. mirabilis, a method for evaluating a compound for the ability to bind a P. mirabilis polypeptide and a method for screening test compounds for anti-bacterial activity. The polypeptides and polymucleotides are useful as molecular targets for diagnosing, preventing and treating pathological conditions resulting from bacterial infection, as reagents for diagnosis of bacterial diseases, as components of antibacterial vaccines, as targets for antibacterial drugs or as bio-control agents for plants. This sequence represents a Proteus mirabilis polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New Proteus mirabilis polypeptides and polynucleotides, useful as reagents for diagnosis of bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, or as

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated nucleic acid comprising any one of the foll antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid models and itself and itself acid; (2) a host cell containing the vector; (3) an isolated of polypeptide acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or the gene product itself or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound sectivity; (11) a culture comprising strains in which the extent to which each of the strains is present in a culture or collection of product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for dentifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational and shown of an organism. The antisense molecules for rational
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   7;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fit, wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                       셤
                                                                                                                                                                                                                                                                The invention relates to constructing a profile of intronic regions (IRB) from a given taxonomic group of organisms, useful for characterizing target organisms. The method comprises (a) selecting an IR known to be found in some or all members of the taxonomic group; (b) analyzing IR of known members of the taxonomic group; (b) analyzing IR of known members of the taxonomic group. The target organism includes cukaryotes, fungl, in particular Candida or Aspergillus and is suspected of belonging to a smaller taxonomic group than the given taxonomic group. Characterizing a target organism is useful for diagnosing the presence of any organism that contains DNA including fungl, protozoan and other any organism that contains DNA including fungl, protozoan and other members of the animal and plant kingdom. Fungl suitable for detection by intron polymorphism analysis include Candida, Aspergillus, Cryptococcus, Blastomyces for clinical applications and Fusarium, Tilletia and Botrytis for non-clinical applications and Fusarium, Tilletia and Botrytis for non-clinical applications. The method is rapid and accurate in reading frame sequence of a cytochrome oxidase subunit 1 (Cox1) intron central indica
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                   Constructing a profile of intronic regions, useful for characterizing organisms e.g. eukaryotes and fungi, comprises selecting intronic regions from nuclear or organellar gene sequences and analyzing the intronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Intronic region-encoded protein; IREP; antifungal agent; gene therapy;

The invention relates to a method of screening an agent which comprises a nucleic acid coding for a protein that effects intronic region-encoded protein (IRRP)-mediated post-transcriptional processing of RNA. The method involves providing the protein in an assay format adapted for studying the effects of the protein on post-transcriptional processing of pre-mRNA and assaying for the effects in the presence of the agent. The method is useful for producing a composition comprising an agent that modulates IRRP-mediated post-transcriptional processing of RNA for inhibiting growth of a non-human organism, particularly fungus, that is associated with a host organism. The invention is also useful in gene therapy. The present sequence is Tilletia indica cytochrome oxidase subunit 1 (cox1) IRRP protein. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Bax, Bax-resistance, cytostatic, fungicide, immunosuppressive, virucide, vasotroplic, vaccine, gene therapy, proliferative disorder, cancer, apoptosis, fungal, yeast, infection, autoimmune disease; ischaemia, neurodegeneration, cell death.

This invention describes a novel nucleic acid representing a synthetic Bax gene. The Bax gene of the invention is useful for identifying Baxresistant yeast or fungi, identifying, or obtaining and identifying Baxcandida spp. sequences that are differentially expressed in a pathway eventually leading to programmed cell death. The products of the invention have cytostatic, fungicide; immunosuppressive, virucide and vasotropic activity and can be used in vaccines or for gene therapy. The invention have cytostatic, fungicide; immunosuppressive, virucide and vasotropic activity and can be used in vaccines or for gene therapy. The invention have cytostatic, fungicide; immunosuppressive, virucide and vasotropic activity and can be used in vaccines or for gene therapy. The isotropic activity and antibodies are useful as medicaments or in preparing a medicament for treating, preventing and/or alleviating ascence, or for preventing apportes in certain diseases. The compounds or polypeptides, or the genetically modified organism are useful for preparing a medicament for modifying the endogenic flora of humans and other mammals. The vaccine is useful for immunising against yeast or fungal infections. Apoptosis-related diseases include autoimmune disease, the sequence represents a polypeptide associated with the Bax gene control of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Streptococcus, GAS, GBS, group B streptococcus, Streptococcus agalactiae, group A streptococcus, Streptococcus pyogenes, antibacterial, antinflammatory, infection, vaccine, meningitis, gene therapy.
New isolated nucleic acid representing a synthetic BAX-gene, useful as medicament for treating, preventing and/or alleviating yeast or fungal infections or proliferative disorders, or for preventing apoptosis in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Fraser C;

streptococcus/GBS (Streptococcus agalaciae) or group A streptococcus/GBS (Streptococcus/GBS (Streptococcus/GBS (Streptococcus/GBS (Streptococcus/GBS (Streptococcus/GBS (Streptococcus/GBS (Streptococcus/GBS (Streptococcus/GBS (Streptococcus pyogenes), comprising one of 5483 sequences (S1), given in the specification. The proteins have antibacterial and antihilammatory activity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactice and S. pyrogenes. Nucleic acids encoding (I) are used to detect Streptococcus in a bilogical sample. (I) is used to determine whether a compound binds to (I). A composition comprising (I) or a nucleic acid encoding (I), may be used as a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be maningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity chromatography, immunoassays, and distinguishing/identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                New Streptococcus protein for the treatment or prevention of infection or disease caused by Streptococcus bacteria, such as meningitis, and for detecting a compound that binds to the protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cytoplasmic, vaccine; prevention; treatment; infection; identification; binding compound; bacterium; life cycle; activator; bacteria; inhibitor; duodenal ulcer disease; chronic gastritis; diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Helicobacter pylori nucleic acid sequences and related polypeptide(s) useful for vaccines to treat or prevent H. pylori infection, and to detect Helicobacter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The protein may identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were
               The present sequence is a Helicobacter pylori protein, which may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in B. coli hosts

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGK) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cartivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food superprise in tissue, as molecular weight markers and as a food involving aberrant protein expression or biological activity. The involving aberrant protein expression or biological activity. The diagnostics, forensics gene mapping, identifications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences ABGO0010-ABG30377 represent novel human diagnostic maino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in
                                                                                                                                                                            ö
analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts

```
The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher enkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABBS7177-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                       Drosophila; developmental biology; cell signalling; insecticide;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to isolated Acinetobacter baumannii nucleic acids. The A. baumannii nucleic acids and polypeptides are useful as reagents for disgnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, to detect the presence of A. baumannii and other Acinetobacter species in a sample, in screening compounds for the ability to interfere with the A. baumannii life cycle or to inhibit A. baumannii infection, and as biocontrol agents for plants. The present sequence represents the amino acid sequence of an A.
                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

This represents a novel human secreted protein (MHP) that share structural similarity with animal ceruloplasmins. MHP oligonucleotides are useful as hybridization probes for screening libraries and assessing gene expression patterns. Sequences derived from regions adjacent to the intron/exon boundaries of NHP gene can be used to design primers for use in amplification assays to detect mutations within the exons, splice in amplification assays to detect mutations within the exons, splice costres, introns that can be used in diagnostics and pharmacogenomics. MHP mucleotide sequences are useful for drug screening and nucleotide construct encoding NHP products are useful in gene therapy for modulating NHP expression and to product an encoding in your of express NHP products in vivo. NHP products e.g. NHP fusion protein products, NHP antibodies and antegonists or agonists are useful as therapeutics i.e., for the treatment of Wilson's disease. The encoded NHP colyppeptides are useful for generating antibodies, as reagents in diagnostic assays, for identifying other cellular gene products related to NHP and as reagents in assays for screening for compounds that are useful in the treatment of mental, biological or medical disorders and
                                                                                                                                                                                                                                                                                                                                                                                                                                    structural similarity with animal ceruloplasmins, useful for drug
screening, diagnosis and treatment of biological disorders or imbalances.
                                                                                                                                                                                                                                                                                                                                                                                                              polynucleotides encoding human secreted proteins that share

Novel human secreted proteins and polynucleotides for diagnosing, preventing or treating cell proliferative, autoimmune/inflammatory, cardiovascular, neurological and developmental disorders.

Claim 1; Page 164-166; 234pp; English

The invention describes an isolated polypeptide chosen from secreted proteins (1), SECP 1-54. (1) and the polynucleotide encoding it (II) are useful for screening a compound for effectiveness as an agonist or compound that alters expression of (II). (I), the identified agonist and antagonist are useful for treating a disease or condition associated altered expression of functional SECP in a patient. An antibody specific to (I) is useful for detecting the presence of (I), puritying (I) from a sample and for diagnosing a condition or disease associated with expression of SECP in a subject or in a biological associated with expression of SECP in a subject or in a biological associated with expression of SECP in a subject or in a biological asmple. (I) and (II) and modulators of (I) are useful for diagnosis, treatment and prevention of cell proliferative disorders (e.g. cancer, keratoris, arterisoclarosis, atheroscierosis, arterisoclarosis, atheroscierosis, atheroscierosc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to multiprotein complexes from eukaryotes. Proteins ABR52568-ABR53003 and ACC6010-ACC61944 respectively. The complexes are obtainable by using a protein as a bait and isolating the set of proteins which is attached thereto from cells. Such protein complexes may comprise up to 30 distinct proteins. Protein complexes of the invention are useful for diagnosing a disease or disorder, or as a target for an active agent of a pharmaceutical, preferably a drug target in the treatment or prevention of a disease or disorder. Note: The sequence data for this patent is not represented in the printed specification, but is based on sequence information supplied by the European Patent Office. The complete

Novel antigenic P5-like fimbrin subunit peptides used in vaccines against Haemophilus influenza.

Example 1; Page 30; 68pp; English.

The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAX79955 to AAX79953, and AAX91201 to AAX291252, represent sequences used in the exemplification of the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          antigenic P5-like fimbrin subunit peptides used in vaccines against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes antigenic PS-like fimbrin subunit peptides (LB1(f) peptides) of PS-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAY79955 to AAY79993, and AAZ91201 to AAZ91202, represent sequences used in the exemplification of the present invention

The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various attains. The peptides are used for disgnosis, prevention, and treatment of Heemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract influenzae. Antibodies may also be used in vaccines against H. influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. ANT9995 to ANT9993, and AAZ91201 to AAZ91221 represent sequences used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   surface exposed loop; major outer membrane protein P5; MOMP P5; non-typeable H. influenzae; ntHi; LB1(f) peptide; B cell epitope; otitis media; sinusitis; conjunctivitis; loops lower respiratory tract infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequences given in AAB47439-46 represent peptides which may be used to replace one or more surface exposed loops of major outer membrane protein PS; (MOMP PS) of non-typeable H. influencae (ntill.). Each of these peptides contain an LB1 (f) peptide which is a 19 amino acid peptide derived from the sequence of WOMP PS from strain ntHill28, representing amino acids Argl17 to G1913. This peptide represents the third exposed loop of PS and is a potential B cell epitope. The loops of the invention are modified in terms of behing in a non-native environment in the recombinant outer membrane protein. The modified MOMP PS may be used to induce an immune response in a mammal to prevent or treat Haemophilus sinfluencae infection or associated disease, e.g., otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection
                                                                                                                                                                                                                                                                                              Recombinant bacterial outer membrane protein where one or more surface-exposed loops are modified is useful as a vaccine to prevent or treat Haemophilus influenzae infection or associated disease, e.g., otitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

Haemophilus influenza.
                                                                                                                                                                                                                                                                                                                  The sequences given in AAB47439-46 represent peptides which may be used to replace one or more surface exposed loops of major outer membrane protein PS, (MOMP PS) of non-typeable H. influenzae (ntHi). Each of these peptides contain an LBI(F) peptide which is a 19 amno acid peptide derived from the sequence of MOMP PS from strain ntHill28, representing amino acids Argll7 to Glyl35. This peptide represents the third exposed loop of PS and is a potential B cell epitope. The loops of the invention are modified in terms of being in a non-native environment in the recombinant outer membrane protein. The modified MOMP PS may be used to induce an immune response in a mammal to prevent or treat Haemophilus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Vaccine; non-typeable Haemophilus influenzae; ntHi; infection; chimeric protein; Haemophilus influenzae; P5-like fimbrin protein; lipoprotein D; LB1(f); immunogenic; antigenic; otitis media; sinusitis; conjunctivitis; lower respiratory tract infection.
                                                                   Recombinant bacterial outer membrane protein where one or more surface exposed loops are modified is useful as a vaccine to prevent or treat Haemophilus influenzae infection or associated disease, e.g., otitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     influenzae infection or associated disease, e.g., otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        4; Length 22;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes antigenic P5-like fimbrin subunit peptides (LB)(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otils media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAV71955 to AAY7993, and AAX21201 to AAX21202, represent sequences used in the exemplification of the present invention
                                                                   otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel antigenic P5-like fimbrin subunit peptides used in vaccines against
Haemophilus influenza.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAY19955 to AAX79993, and AAZ91201 to AAZ91252, represent sequences used in the exemplification of

The invention relates to the manufacture of a synthetic chimeric peptide comprising a non-typable Haemophilus influenzae fimbrin peptide fused vis a linker peptide to a T-cell epitope peptide. The chimeric peptide is used in immunogenic compositions which induce an immune response against non-typable Haemophilus influenzae. This sequence represents an example of a H. influenzae fimbrin peptide used to generate the chimeric peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a synthetic chimeric fimbrin peptide. The peptide is useful for treating a non-typable Haemophilus influenzae (NTH) inflection and orlism media. The synthetic peptides do not require tedious purification techniques. The present sequence represents the amino acid sequence of H. influenzae fimbrin subunit peptide #1.
                                                                                                                                 Synthetic chimeric fimbrin peptide - useful for vaccination against non-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Synthetic chimeric fimbrin peptide, useful for treating Haemophilus influenzae infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 fimbrin; non-typable Haemophilus influenzae; NTH1 infection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      H. influenzae fimbrin subunit peptide #1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ADA25163 standard; peptide; 18 AA.

                                                                                                                                                                                                                                                                                                                                                                               Novel antigenic P5-like fimbrin subunit peptides used in vaccines against Haemophilus influenza.
                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAY79955 to AAY7993, and AAZ91201 to AAZ91222, represent sequences used in the exemplification of the present invention

Novel antigenic P5-like fimbrin subunit peptides used in vaccines against Haemophilus influenza.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Hamomophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Hamomophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAZ99255 to AAX79953, and AAZ91201 to AAZ91252, represent sequences used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Vaccine; non-typeable Haemophilus influenzae; ntHi; infection; chimeric protein; Haemophilus influenzae; P5-like fimbrin protein; lipoprotein D; LB1(f); immunogenic; antigenic; otitis media; sinusitis; conjunctivitis; lower respiratory tract infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a synthetic chimaeric fimbrin peptide LB1 or LB2 comprises a first peptide unit derived from H. influenzae fimbrin, a second peptide unit containing a reall epitope and a third linker peptide which connects the first peptide to the second. The chimaeric peptide is useful for inducing an immune response in animals against non-typable Haemophilus influenzae (NTHi) and for preventing or reducing adherence of NTHi to host cells thereby preventing or reducing the severity of otitis media. The present sequence is an H. influenzae fimbrin peptide for use in the chimaeric peptides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel synthetic chimeric fimbrin peptide LB1 or LB2 comprising a first peptide unit, T cell epitope as second peptide unit and third linker peptide unit, useful for preventing or reducing severity of otitis media.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                           ö
                                                                                                              Novel antigenic P5-like fimbrin subunit peptides used in vaccines against
                                                                                                                                                        The present invention describes antigenic P5-like fimbrin subunit peptides (LBI(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinustis, conjunctivitis, or lower respiratory tract influenzae. Antibodies may also be used in vaccines against H. Influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAY79955 to AAY7993, and AAZ91201 to AAZ91252, represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      antigenic P5-like fimbrin subunit peptides used in vaccines against

Haemophilus influenza.
                                                                peptides (LBI(f) peptides) of P5-like fimbrin proteins strong various Haemophilus influenzes strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzes infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAY79955 to AAX79993, and AAX91201 to AAX91252, represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. antigenic P5-like fimbrin subunit peptides used in vaccines against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. ANY19955 to AAX79933, and AAX91201 to AAX91252, represent sequences used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Vaccine; non-typeable Haemophilus influenzae; ntHi; infection; chimeric protein; Haemophilus influenzae; PS-like fimbrin protein; lipoprotein D; LBI ; immunogenic; antigenic; coitis media; sinusitis; conjunctivitis; lower respiratory tract infection.
                                                                                             Vaccine; non-typeable Haemophilus influenzae; ntHi; infection; chimeric protein; Haemophilus influenzae; P5-like fimbrin protein; lipoprotein D; LB1(f); immunogenic; antigenic; otitis media; sinusitis; conjunctivitis; lower respiratory tract infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel antigenic P5-like fimbrin subunit peptides used in vaccines against
Haemophilus influenza.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzes etrains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzes infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzes. Antibodies and probes from the present invention can be used AAZ01201 to AAZ01202, represent sequences used in the exemplification of the present invention

                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                      Novel antigenic P5-like fimbrin subunit peptides used in vaccines against
                                                                                                                                                                                 The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAX79955 to AAX79953, and AAX91201 to AAX91252, represent sequences used in the exemplification of

                                                                                                                                                                                                                                 The sequences given in AAB47439-46 represent peptides which may be used to replace one or more surface exposed loops of major outer membrane protein Ps (MOMP Ps) of non-typable H. influenzae (ntill). Each of these peptides contain an LB1(f) peptide which is a 19 amino acid peptide derived from the sequence of MOMP Ps from strain ntHill28, representing amino acids Argl17 to Gly135. This peptide represents the third exposed loop of Ps and is a potential B cell epitope. The loops of the invention are modified in terms of being in a non-native environment in the recombinant outer membrane protein. The modified MOMP Ps may be used to induce an immune response in a mammal to prevent or treat Haemophilus influenzae infection or associated disease, e.g., otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection
Recombinant bacterial outer membrane protein where one or more surface-
exposed loops are modified is useful as a vaccine to prevent or treat
Haemophilus influenzae infection or associated disease, e.g., otitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Immunoglobulin E; IgE; immunogenic; immunogen; Protein D; carrier; prostate cancer; Haemophilus influenzae; vaccine; infectious disease; malaria; cytostatic; antiallergic; nootropic; neuroprotective; protozoacide; Alzheimer's disease; allergy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ò
                                              The present invention describes an immunogen (I) comprising a peptide (Ia) and a carrier (Ib) derived from protein D of Haemophilus influenzae or its fragment. Also described are: (I) a vaccine comprising (I), and an excipient; (2) preparation of (I), comprising conjugating a peptide to protein D or its fragment; and (3) preparation of a vaccine of (I), comprising formulating (I) with an excipient. (I) has cytostatic, contraining formulating (I) with an excipient. (I) has cytostatic, nortropic, neuroprotective and protozoacide activities. (I) and the vaccine are useful for the manufacture of a medicament for preventing and treating infectious diseases such as malaria or chronic preventing and treating infectious disease such as malaria or chronic consists and protostatic and the vaccine are timmunogens, (I) induces high levels of antippetide immune responses while inducing a moderate humoral response against the carrier. The present sequence represents an IslgrI peptide which was coupled through an additional C-terminal cysteine via maleimide to
                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequences given in AAB47439-46 represent peptides which may be used to replace one or more surface exposed loops of major outer membrane protein P5 (MOMP P5) of non-typeable H. influenzae (ntHi). Each of these peptides contain an LB1(f) peptide which is a 19 amino acid peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Recombinant bacterial outer membrane protein where one or more surface-exposed loops are modified is useful as a vaccine to prevent or treat Haemophilus influenzae infection or associated disease, e.g., otitis
                                                                                                                                                                                                                                                                                                                                Gaps
comprises peptide and carrier from protein D of influenzae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              surface exposed loop; major outer membrane protein P5; MOMP P5;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to the manufacture of a synthetic chimeric peptide comprising a non-typable Haemophilus influenzae fimbrin peptide fused via a linker peptide to a T-cell epitope peptide. The chimeric peptide is used in immunogenic compositions which induce an immune response against non-typable Haemophilus influenzae. This sequence represents an example of a chimeric fimbrin/T-cell epitope peptide and is designated LBI. The peptide comprises a 19 amino acid sequence corresponding to amino acids 117-135 of the fimbrin protein, the linker sequence and amino acid 208-302 of the measles virus fusion protein (a T-cell epitope)
derived from the sequence of MOMP P5 from strain ntHill28, representing amino acids Argl17 to Gly135. This peptide represents the third exposed loop of P5 and is a potential B cell epitope. The loops of the invention are modified in terms of being in a non-native environment in the recombinant outer membrane protein. The modified MOMP P5 may be used to induce an immune response in a mammal to prevent or treat Haemophilus influenzae infection or associated disease, e.g., otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Synthetic chimeric fimbrin peptide - useful for vaccination against non-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Chimeric; non-typable Haemophilus influenzae; fimbrin; T-cell epitope; immunogenic composition; immune response.

```
The invention relates to a synthetic chimeric fimbrin peptide. The peptide is useful for treating a non-typable Haemophilus influenzae (NTH1) inflection and otitis media. The synthetic peptides do not require teditus purification techniques. The present sequence represents the amino acid sequence of the chimeric fimbrin peptide LB1.
                                                                                                                                                                                                                                                                                                                                                   Synthetic chimeric fimbrin peptide, useful for treating Haemophilus

    H. influenzae fimbrin peptide/T cell epitope chimaera LB1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Fimbrin, T cell epitope, vaccine, otitis media, auditory; antiinflammatory, LB1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel antigenic P5-like fimbrin subunit peptides used in vaccines against
Haemophilus influenza.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              peptides (LB16f) peptides) of PS-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract influenzae. Antibodies may also be used in vaccines against H. influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAY79955 to AAY79933, and AAZ91201 to AAZ91252, represent sequences used in the exemplification of the present invention
                                                                                                                                                                                              Vaccine; non-typeable Haemophilus influenzae; ntHi; infection; chimeric protein; Haemophilus influenzae; P5-like fimbrin protein; lipoprotein D; LB1(f); immunogenic; antigenic; otitis media; sinusitis; conjunctivitis; lower respiratory tract infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes antigenic P5-like fimbrin subunit

                                                                                                                                                                                           ଚ
                                                                                                                                                                                                                                              ö
                                                                               The invention relates to a synthetic chimaeric fimbrin peptide LB1 or LB2 comprises a first peptide unit derived from H. influenzae fimbrin, a second peptide unit containing a reall epitope and a third linker peptide which connects the first peptide to the second. The chimaeric peptide which connects the first peptide to the second. The chimaeric peptide is useful for inducing an immune response in animals against non-typable Haemophilus influenzae (NTHi) and for preventing or reducing adherence of NTHi to host cells thereby preventing or reducing the severity of otitis media. The present sequence is an H. influenzae fimbrin peptide/measles virus T cell epitope chimaeric peptide of the
                  Novel synthetic chimeric fimbrin peptide LB1 or LB2 comprising a first peptide unit, T cell epitope as second peptide unit and third linker peptide unit, useful for preventing or reducing severity of otitis media.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Vaccine comprising non-typable Haemophilus influenza fimbrin protein - useful in studying, preventing or reducing the severity of otitis media, also fimbrin protein and DNA.

clinical isolates of Haemophilus influenzae share common epitopes. Thus frimbrin isolated from non-typable Haemophilus influenzae 1128 strain is a particularly suitable immunogen to protect against the different non-typable HJ. influenzae that cause otitis media. Fimbrin protein is produced by culturing a transformed microbial host, pref. B.coli, Sporodoptera frugiperda or a mucosal pathogen. Fimbrin protein (FP) produced by this process is claimed. The FP protein migrates in polyacrylamide genes to a posn. equiv. to a mol. wt. of 25.5 kD or 37.5 kD. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 25-MAR-2003 to correct PN field.) (Updated on 25-MAR-2003 to correct DA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:
(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated nucleic acid comprising any one of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antisense; prokaryotic essential gene; cell proliferation; drug design.

proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits callular proliferation, (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation required for the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene product is overaxpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for acidentifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational dentifying proteins or screening for homologous nucleic acids acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. acruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this pattent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the private of the private and the companies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel antigenic P5-like fimbrin subunit peptides used in vaccines against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Vaccine, non-typeable Haemophilus influenzae, ntHi; infection; chimeric protein; Hamphilus influenzae; PS-like fimbrin protein; lipoprotein D; LBI(f); immunogenic; antigenic; otitis media; sinusitis; conjunctivitis; lower respiratory tract infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes antigenic P5-like fimbrin subunit peptides (LBI(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as octifis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAX79555 to AAX7953, and AAX31201 to AAX21252, represent sequences used in the exemplification of the present invention

                                                                                                                                                                                                                                                                                                                                                                                     Novel antigenic P5-like fimbrin subunit peptides used in vaccines against
Haemophilus influenza.
                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract influenzae. Antibodies may also be used in vaccines against H. Influenzae, Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAY79955 to AAY7993, and AAZ91201 to AAZ91252, represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Vaccine, non-typeable Haemophilus influenzae, ntHi; infection, chimeric protein, Haemophilus influenzae, P5-like fimbrin protein; lipoprotein D; LBl(f); immunogenic; antigenic; otitis media; sinusitis; conjunctivitis; lower respiratory tract infection.
                                                                                                                   Vaccine, non-typeable Haemophilus influenzae, ntHi; infection; chimeric protein; Haemophilus influenzae; PS-INke fimbrin protein; lipoprotein D; LBI(f); immunogenic; antigenic; otitis media; sinusitis; conjunctivitis; lower respiratory tract infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                             antigenic P5-like fimbrin subunit peptides used in vaccines against
                                                                                                                                                                                  peptides (LBI(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. Influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAY79955 to AAY7993, and AAS91201 to AAA291252, represent sequences used in the exemplification of the present invention

                                                             The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. Novel antigenic P5-like fimbrin subunit peptides used in vaccines against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          peptides (LBI(f) peptides) of PS-like fimbrin proteins from various Haemophilus influenzes strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as ortis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae. Antibodies and probes from the present invention can be used AZ391201 to AAZ91252, represent sequences used in the exemplification of the present invention
                                                                                                                                                Vaccine; non-typeable Haemophilus influenzae; ntHi; infection; chimeric protein; Haemophilus influenzae; PS-like fimbrin protein; lipoprotein D; LBI(f); immunogenic; antigenic; otitis media; sinusitis; conjunctivitis; lower respiratory tract infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Vaccine, non-typeable Haemophilus influenzae; ntHi; infection; chimeric protein; Hemophilus influenzae; P5-like fimbrin protein; lipoprotein D; LB1(f); immunogenic; antigenic; otitis media; sinusitis; conjunctivitis; lower respiratory tract infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel antigenic P5-like fimbrin subunit peptides used in vaccines against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. Tillenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AX79955 to AX79953, and AX291201 to AA291252, represent sequences used in the exemplification of

The present invention describes an isolated polymucleotide (1) of
Alloiococcus otitidis genomic DNA, which encodes an antigenic protein.
Alloiococcus otitidis is a Gram-positive bacterium. Also described: (1)
an isolated polypeptide that is encoded by the polymucleotide (1), its
complement, degenerate variant or fragment; (3) a genetically engineered
the stansfected, transformed or infected with the vector of (2);
(4) an antibody specific for the polypeptide of (1); (5) an immunogenic
composition comprising the polypeptide of (1); (5) an immunogenic
composition comprising the polypeptide of (1); (6) an immunogenic
composition comprising the polypeptide, its composition comprising the
expression vector; (6) a pharmaceutical composition comprising the
copypeptide of (1) and a carrier; (7) a protein chip comprising the
copypeptide of (1), their biological equivalent or fragment;
cof the polypeptides of (1), their biological equivalent or fragment;
cof the polypeptides of (1), their biological equivalent or has the
cottidia in the biological sample; (10) a kit comprising a container,
containing the novel polymucleotide, its degenerate variant or fragment,
cortining the novel polymucleotide, its degenerate variant or fragment,
cortining the novel polymucleotide, its degenerate variant or fragment,
cortining the novel polymucleotide, its degenerate variant or fragment,
cortining the novel polymucleotide, its degenerate variant or fragment,
cortining the novel polymucleotide, its degenerate variant or fragment
contraining the polympetides, antibodies and compositions of the present
to polymucleotides, polypeptides, antibodies and compositions of the present
cortining assays and monitoring of effects during diagnosing Aug
cortining the persent sequence represente an Alloiococcus
cottidias. The persent sequence represente an Alloiococcus
cottidias.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
New Alloiococcus otitidis polynucleotides and polypeptides, useful for treating and diagnosing diseases, drug screening assays and monitoring of effects during drug clinical trials.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /note= "amino acid at position 195 is not identified in the specification"

```
Nontypable H. influenzae HI outer membrane protein P5 was isolated by extraction of the outer membrane with detergents and cation-exchange chromatography. P5 (or its peptide fragmente) are used in vaccines for prevention of H. influenzae infections implicated in otitis media, sinusitis and chronic pulmonary obstructive disease
                                                                                                                                                 Purified H.influenzae P5 outer membrane protein - used for preventing reducing susceptibility to or treating H.influenzae infections.
                                                                                                                                                                                                  Disclosure; Page 7-8; 16pp; English.
